

Introduction

[illegible]

Problem Statement & Objectives

Housing information is often stored in different formats, making analysis difficult. The objective is to collect, clean, and visualize housing data to identify trends, compare regions, and support data-driven decisions. The project also aims to build interactive dashboards that help users filter data by location, price, or property type. Housing information is often stored in different formats, making analysis difficult. Dataset & Data Collection

[illegible]

Data Cleaning & EDA

Data cleaning includes removing duplicate records, handling missing values, correcting inconsistent formats, and converting data types. Exploratory Data Analysis (EDA) summarizes the dataset using descriptive statistics and identifies trends, outliers, and relationships between variables. This stage ensures reliable visualization results. Data cleaning includes removing duplicate records, handling missing values, correcting inconsistent formats, and converting data types. Exploratory Data Analysis (EDA) summarizes the dataset using descriptive statistics and identifies trends, outliers, and relationships between variables. This stage ensures reliable visualization results. Data cleaning includes removing duplicate records, handling missing values, correcting inconsistent formats, and converting data types. Visualizations & Dashboard

[illegible]

Key Findings

The analysis may reveal which regions have the highest average prices, where affordable housing is available, seasonal demand patterns, and relationships between house size and price.

Decision-makers can use these insights to improve housing policies, investment strategies, and urban development plans.
